Criteria	Measurement Parameter
Cellcontrast [CC]	 This describes the brightness difference (standardised) between bright and dark dots determined from their average values.
Minimum Reflectance [MR]	 This describes the brightness difference between the bright modules and the determined brightness of the bright modules in the calibration template.
Cell Modulation [CM]	 This describes the grey value uniformity in the bright or dark modules.
Finder Damage [FD]	 Damage in the Finder and Alternating Grid and Quietzone.
Distributed Damage [DD]	 Summarised assessment of the individual Fixed Pattern zones.
Axial Nonuniformity [AN]	 This describes the distortion of code along its main axes in X and Y direction.
Global Nonuniformity [GN]	 Deformity of the grid. Evaluates the position of the individual module relative to an ideal uniform grid.
Unused Error Correction [UE]	 Unused error correction. A measure of the number of bit errors that had to be corrected using the Reed/Solomon error correction.
